

complexity theory

clouds, the weather, rivers, organisms, stockmarkets
minds, societies, narrative fields
the more we learn about complex adaptive dynamic systems
 quantum to galactic to Living networks
the more reason we have to hope

consider Earth:
a fractal Garden poiesis
everywhere Self-similar
 permeated with mystery and wonder
Self-organizing in feedback loop relationships from the ground up
the whole greater than the analyzable parts

each of us choosing
within our horizon of possible thoughts / words / acts
wanting only to get closer to free

yet aware sustainability has certain conditions
 call it what we will —
either we create a bifurcation
or pass the children unpayable debt
a World on the edge of ecological collapse

the genius of human intelligence
we can correct mistaken narrative
we can improve —
if we grasp the roots of our problem
and each use what power we have
there's no predicting the effective reach
