

science

scientists work with data

limit themselves to measurement and description

they deal with physical appearances only

Matter. Energy. Earth. Life.

they trace the Pathways our Ancestors took

piecing together how the Universe might have started

where we came from

what makes us up

scientists hypothesize, argue, prove or disprove theories

based on Evidence. Facts.

always peer reviewed

always questioning further

crossing the river on stepping stones

scientists know they don't know everything

their Cosmos too filled with wonder, mystery, infinitude

more and more wading into how Mind is linked with Matter

seeing beyond the mechanical model

without resorting to the Medieval World of anything goes

superstition, theological speculation, tradition, fantasy...

aware the advent of the Anthropocene

cities, transportation, communication, medicine, nuclear bombs,

hypersonics, information warfare, climate change related weather events

all bear witness that scientists do know some things

and as a community would agree

on some things

successful complex adaptive dynamic systems, for instance,

learn, adapt and change when needed

when traveling sustainable Pathways
